Why is `cls` sometimes used instead of `self` as an argument in Python classes? For example: class Person: def `__init__`(self, firstname, lastname): self `rstname` = `firstname` `self`.

Are you supposed to use `self` when referencing a member function in Python (within the same module)? More generally, I was wondering when it is required to use `self`, not ...

When `self` is accessed in a type method (static func or class func), it refers to the actual type (rather than an instance). When `self` is used this way, it actually returns what in ...

`A.x` is a class variable. `B` "s `self.x` is an instance variable. i.e. `A` "s `x` is shared between instances. It would be easier to demonstrate the difference with something that can be modified like a list:

In this case, there are some benefits to allowing this: 1) Methods are just functions that happen defined in a class, and need to be callable either as bound methods with `implicit` ...

`Self` is an alias for the type that the `impl` block is for. The rules of ownership and borrowing apply to `self` as they apply to any other parameter (see e.g. this answer). Examples ...

For a language-agnostic consideration of the design decision, see What is the advantage of having this/`self` pointer mandatory explicit?. To close debugging questions where OP omitted a ...

17 What is `self`? In Python, every normal method is forced to accept a parameter commonly named `self`. This is an instance of class - an object. This is how Python methods ...

9 First, Python's `self` is not a keyword, it's a coding convention, the same as Python's `cls`. Guido has written a really detailed and valuable article about the origin of Python's support for class, ...

I think it is setting the id for each list item as each item in the numbers array? Correct me if wrong - but is each id being set as whatever Int is in each entry of the numbers array? If ...
