-----  
What is the minimum STC rating for polyiso insulation?

The International Building Code specifies a minimum STC rating of 50 for walls and floors in multi-family dwellings to ensure acceptable noise control. By prioritizing the STC ratings of insulation, Rmax polyiso products help builders meet or exceed these requirements, ensuring both compliance and peace of mind for occupants.

What are acoustical requirements?

Cities throughout the United States have building codes that typically include acoustical requirements. These code mandates are specified in terms of ASTM standards. The most common standards used in building codes are Sound Transmission Class (STC) and Impact Insulation Class (IIC).

How do STC ratings affect soundproofing?

The higher the rating, the more effective the soundproofing. These ratings are determined by testing materials' ability to dampen sound across a range of frequencies, offering valuable insight into the STC ratings of insulation and its role in producing a quiet environment.

Why is polyiso a good acoustic insulation?

Insulation, specifically polyiso, contributes to better STC ratings by addressing sound absorption and blocking. Proper insulation minimizes sound waves traveling through walls, floors, and ceilings, significantly improving indoor acoustic environments. With Rmax products, builders can reduce noise pollution while also achieving energy efficiency.

Cities throughout the United States have building codes that typically include acoustical requirements. These code mandates are specified in terms of ASTM standards. The most ...
